- Review by the European Society of Human Reproduction and Embryology (2010): **The main issue that needs to be urgently addressed in order to improve the overall IVF success is embryo quality evaluation.**
- Current embryo viability evaluation methods depend on the embryologist personal experience and could be qualified more as **art** rather than **science**.

Embryo viability analysis

Problem statement

- ❖ Motivation
- ❖ Embryo viability analysis
- ❖ Some technical details
- ❖ Caenorhabditis elegans
- ❖ C. Elegans embryos

Mathematics meets genetics

Virtual microscope

Experiments

Numerical methods

Concluding remarks

Human embryo is a thick (up to $100\mu m$ in diameter) almost transparent cell. It cannot be stained or damaged, which limits its observation to specific microscopic modalities and also to the short observation time.

Embryo viability analysis

Problem statement

❖ Motivation

❖ Embryo viability analysis

❖ Some technical details

❖ Caenorhabditis elegans

❖ C. Elegans embryos

Mathematics meets genetics

Virtual microscope

Experiments

Numerical methods

Concluding remarks

Human embryo is a thick (up to $100\mu m$ in diameter) almost transparent cell. It cannot be stained or damaged, which limits its observation to specific microscopic modalities and also to the short observation time.

The Differential Interference Contrast (DIC) microscope is commonly used in fertility clinics and the Hoffmann Modulation Contrast (HMC) microscope is employed to lesser degree.

Embryo viability analysis

The Differential Interference Contrast (DIC) microscope is commonly used in fertility clinics and the Hoffmann Modulation Contrast (HMC) microscope is employed to lesser degree.

Following a very short (1-2 min.) daily observation, the embryologists examine the shape and the symmetry of the distribution of blastomeres (cells composing the embryos).

Based on the impression from the number of two-dimensional images, the embryos are scored, with the highest score reflecting the potential of the embryo to successfully implant within the uterine cavity.

Some technical details

Problem statement

- ❖ Motivation
- ❖ Embryo viability analysis

❖ Some technical details

- ❖ *Caenorhabditis elegans*
- ❖ *C. Elegans* embryos

Mathematics meets genetics

Virtual microscope

Experiments

Numerical methods

Concluding remarks

(a) two-blastomere human embryo, (b) eight-blastomere human embryo

- The image has a *relief-like* quality, exhibiting a shadow-cast effect.
- The shadows and highlights indicate the sign and the slope of phase gradient.
- The direction of shadow casting reverses for structures with refractive indices that are lower and higher than the surrounding medium

Some technical details

Numerical methods

Concluding remarks

Properties of refractive index

Problem statement

Mathematics meets
genetics

❖ Algorithm

❖ Properties of refractive
index

❖ Reconstruction of
genetic properties

Virtual microscope

Experiments

Numerical methods

Concluding remarks

- The refractive index is proportional to the concentration of organic molecules.

Properties of refractive index

Problem statement

Mathematics meets
genetics

❖ Algorithm

❖ Properties of refractive
index

❖ Reconstruction of
genetic properties

Virtual microscope

Experiments

Numerical methods

Concluding remarks

- The refractive index is proportional to the concentration of organic molecules.
- It can be used to quantify the aggregation and the surface coverage of cellular proteins and the growth and architectural changes in cells.

Properties of refractive index

Problem statement

Mathematics meets
genetics

❖ Algorithm

❖ Properties of refractive
index

❖ Reconstruction of
genetic properties

Virtual microscope

Experiments

Numerical methods

Concluding remarks

- The refractive index is proportional to the concentration of organic molecules.
- It can be used to quantify the aggregation and the surface coverage of cellular proteins and the growth and architectural changes in cells.
- **Conventional assertion:** rapid cell division and proliferation activity of cancer cells lead to high concentration of protein molecules within cellular organelles and result in the increase of cell refractive index.

Properties of refractive index

- Information about the **aneuploidy** (missing or additional chromosomes) could be extracted from the refractive index distribution. It is a #1 reason behind the failure of the IVF procedure. **Aneuploidy is also a major hallmark of cancer!**
- **Experimental confirmation for cancer cells:** Tomographic Phase Microscope (*X-rays*), Optical Coherence Microscope (*Infrared*).

Reconstruction of genetic properties

Problem statement

Mathematics meets genetics

❖ Algorithm

❖ Properties of refractive index

❖ Reconstruction of genetic properties

Virtual microscope

Experiments

Numerical methods

Concluding remarks

The total chromosomal dry mass:

$$m_{chromosome} = \frac{1}{\alpha} \iiint_{V_c} [n(x, y, z) - n_{medium}] dV,$$

where $n(x, y, z)$ and n_{medium} are the refractive index of the chromosome and the culture medium; V_c is the chromosome region; α is the increase in the refractive index value per unit increase in the concentration of the constituent molecules.

Reconstruction of genetic properties

Problem statement

Mathematics meets genetics

❖ Algorithm

❖ Properties of refractive index

❖ Reconstruction of genetic properties

Virtual microscope

Experiments

Numerical methods

Concluding remarks

The total chromosomal dry mass:

$$m_{chromosome} = \frac{1}{\alpha} \iiint_{V_c} [n(x, y, z) - n_{medium}] dV,$$

where $n(x, y, z)$ and n_{medium} are the refractive index of the chromosome and the culture medium; V_c is the chromosome region; α is the increase in the refractive index value per unit increase in the concentration of the constituent molecules.

Refractive index distribution $n_{cell}(x, y)$ at transverse position (x, y) :

$$n_{cell}(x, y) = \frac{\lambda_0}{4\pi} \frac{\Delta\varphi(x, y)}{t(x, y)} + n_{medium}(x, y).$$

Here λ_0 is a center wavelength in free space, $\Delta\varphi(x, y)$ is a phase map and $t(x, y)$ is a physical thickness of cell at position (x, y) across the cell.

Problem statement

Three-stage model

Problem statement

Mathematics meets
genetics

Virtual microscope

❖ Three-stage model

❖ Objective Lens

❖ Fields on the exit pupil

❖ Objective → Detector
Plane

Experiments

Numerical methods

Concluding remarks

DIC microscope:

1. **Object** → **Objective** 2. **Objective** 3. **Objective** → **Detector**

Stage 1: Numerical solution of time-harmonic Maxwell's equations describing electromagnetic wave scattering by the cell:

$$i\omega\mathbf{B} + \nabla \times \mathbf{E} = 0,$$

$$i\omega\mathbf{D} - \nabla \times \mathbf{H} = 0,$$

Three-stage model

DIC microscope:

1. **Object** → **Objective**
2. **Objective**
3. **Objective** → **Detector**

Stage 1: Numerical solution of time-harmonic Maxwell's equations describing electromagnetic wave scattering by the cell:

$$i\omega\mathbf{B} + \nabla \times \mathbf{E} = 0,$$

$$i\omega\mathbf{D} - \nabla \times \mathbf{H} = 0,$$

For isotropic media we can use the constitutive relations: $\mathbf{B} = \mu\mathbf{H}$ and $\mathbf{D} = \varepsilon\mathbf{E}$, where μ is a constant permeability and $\varepsilon = n^2$ is a space-dependent permittivity.

Objective Lens

Problem statement

Virtual microscope

❖ Three-stage model

❖ Objective Lens

❖ Fields on the exit pupil

❖ Objective → Detector
Plane

Experiments

Numerical methods

Concluding remarks

The field components $U = \{E_x, E_y, E_z\}$ are computed according to *Goodman, Introduction to Fourier Optics*:

$$U'_l(x, y) = T_l U_l(x, y)$$

Fields on the exit pupil

Problem statement

Mathematics meets genetics

Virtual microscope

❖ Three-stage model

❖ Objective Lens

❖ Fields on the exit pupil

❖ Objective → Detector Plane

Experiments

Numerical methods

Concluding remarks

The field components $U = \{E_x, E_y, E_z\}$ are computed according to **Goodman, Introduction to Fourier Optics:**

$$U'_l(x, y) = T_l U_l(x, y)$$

where

$$T_l = e^{\frac{-ik(x^2+y^2)}{2f}} \times \begin{cases} 1 & \text{inside the lens,} \\ 0 & \text{otherwise} \end{cases}$$

is a paraxial approximation of the phase transfer function multiplied by the pupil function

Fields on the exit pupil

Problem statement

Mathematics meets genetics

Virtual microscope

❖ Three-stage model

❖ Objective Lens

❖ Fields on the exit pupil

❖ Objective → Detector Plane

Experiments

Numerical methods

Concluding remarks

The field components $U = \{E_x, E_y, E_z\}$ are computed according to *Goodman, Introduction to Fourier Optics*:

$$U'_l(x, y) = T_l U_l(x, y)$$

where

$$T_l = e^{\frac{-ik(x^2+y^2)}{2f}} \times \begin{cases} 1 & \text{inside the lens,} \\ 0 & \text{otherwise} \end{cases}$$

is a paraxial approximation of the phase transfer function multiplied by the pupil function

The focusing error aberration effect on phase is given by multiplying

$$T_l \text{ by } W_a(x, y) = \exp\left[-\frac{ik(x^2+y^2)}{2} \left(\frac{1}{z_a} - \frac{1}{z_i}\right)\right],$$

where $z_a \neq z_i$

Objective → Detector Plane

Problem statement

Mathematics meets
genetics

Virtual microscope

- ❖ Three-stage model
- ❖ Objective Lens
- ❖ Fields on the exit pupil
- ❖ Objective → Detector Plane

Experiments

Numerical methods

Concluding remarks

The fields components U projected on the detector plane using Fresnel integral:

$$U^d(\xi, \eta) = \frac{e^{ikz_i}}{i\lambda z_i} \iint_{-\infty}^{\infty} U_l'(x, y) e^{\frac{ik[(x-\xi)^2 + (y-\eta)^2]}{2z_i}} dx dy$$

Objective → Detector Plane

Problem statement

Mathematics meets
genetics

Virtual microscope

❖ Three-stage model

❖ Objective Lens

❖ Fields on the exit pupil

❖ Objective → Detector
Plane

Experiments

Numerical methods

Concluding remarks

The fields components U projected on the detector plane using Fresnel integral:

$$U^d(\xi, \eta) = \frac{e^{ikz_i}}{i\lambda z_i} \iint_{-\infty}^{\infty} U_l'(x, y) e^{\frac{ik[(x-\xi)^2 + (y-\eta)^2]}{2z_i}} dx dy$$

The DIC effect on the detector plane is achieved by introducing shifted field interference:

$$I_{DIC}^2 = |E_x^{TE}(x + \delta_s/2, y + \delta_s/2)|^2 + |E_y^{TE}(x + \delta_s/2, y + \delta_s/2)|^2 + |E_z^{TM}(x - \delta_s/2, y - \delta_s/2)|^2,$$

where δ_s is a shear distance and TE and TM correspond to the transverse electrical (perpendicular) and the transverse magnetic (parallel) polarization.
